INTRODUCTION

This memo documents the linear aerodynamic and thrust perturbation model of the X-29 simulation model resident in the Control Integration and Assessment Branch of Wright Laboratory (WL/FIGD) at Wright-Patterson Air Force Base, Ohio. This model was used to perform flying qualities evaluations of the X-29 aircraft at Wright Laboratory during the airplane's development in the early to mid-1980s.

This work was conducted in order to document the X-29 longitudinal and lateral-directional linear aero model at numerous trim flight conditions for use in future research work in flying qualities. The X-29 is representative of typical fighter aircraft, even with its forward-swept wing, although the airframe is very unstable longitudinally.

This memo is divided into four sections: Introduction, Definition of Terms, Explanation of Computer Printouts, and Computer Printouts sections. Definitions of all terms associated with the linear model are given in the Definition of Terms section. Explanation of all of the data in the computer printouts is given in the Explanation of Computer Printouts section. The Computer Printouts section contains the actual computer printouts for each trim flight condition.

Mr Dan Goddard of WL/FIGD wrote much of the original computer software that generated the linear model given in this memo. The software was modified where necessary to make the computer printout easier to understand and to complete the lateral-directional section of the software. Mr Brian Stadler and Mr Joe Nalepka of WL/FIGD resurrected and documented the X-29 aero model for this project and helped immensely in explaining the computer system and software at WL/FIGD.

DEFINITION OF TERMS

The aerodynamic forces and moments for the model are defined in terms of nondimensional aero coefficients, C_x , C_y , C_z , and C_l , C_m , C_n , respectively. The x axis is positive out the front of the airplane, the y axis is positive out the right wing, and the z axis is positive out the bottom of the airplane. The aerodynamic forces and moments are functions of twelve variables, seven in the longitudinal axis and five in the lateral-directional axis. These twelve variables are: angle of attack, pitch rate, Mach number, angle of attack rate, strake deflection, canard deflection, flaperon deflection, angle of sideslip, roll rate, yaw rate, aileron deflection, and rudder deflection. Thrust variation is also included in the linear model and is a function of two variables, Mach number and altitude. Thrust is aligned along the aircraft centerline parallel to the x axis (no inclination angle) above the center of gravity (negative pitching moment).

The linear model is produced by perturbing each of the twelve variables, one at a time, in a positive direction and then in an equal negative direction from the trim value. The partial derivatives required for the nondimensional and dimensional derivatives are calculated by dividing the total variation in each nondimensional aero coefficient or thrust by the total variation in each of the twelve independent variables. Altitude is not

varied in these linear models. All angular and angular rate independent variables are varied plus and minus one degree or one degree/second, respectively. Mach number is varied plus and minus 0.05.

All aero coefficients and nondimensional and dimensional derivatives follow the definitions given in Appendix A of NASA CR-2144 (Reference 1) except for two variations. It was decided to make all sign conventions agree for forces and moments. This is so all nondimensional coefficients and nondimensional and dimensional derivatives are positive in the positive directions of the axis system. Therefore, C_x is the opposite sign of the C_x in NASA CR-2144 and C_z is the negative of the C_N in NASA CR-2144. The lateral-directional L and N dimensional derivatives are converted to primed derivatives as defined in NASA CR-2144 for print out. Please note that all coefficients and derivatives are in a body axis system, not a stability axis system.

The dimensional derivatives are used to generate a longitudinal and lateral-directional state space model according to the following equations. The general form of the state space model is:

$$\dot{x} = Ax + Bu$$

where A is a 4×4 matrix and B is a 4×3 matrix for the longitudinal model or a 4×2 matrix for the lateral-directional model.

Longitudinal State Space Model

The state vector x contains forward speed, angle of attack, pitch rate and pitch angle. The input vector u contains strake, flaperon and canard deflections. The elements of the A matrix are:

$$A(1,1) = X_u^* + \frac{X_{\dot{\alpha}} Z_u^*}{U_0 - Z_{\dot{\alpha}}}$$

$$A(1,2) = X_{\dot{\alpha}} + \frac{X_{\dot{\alpha}} Z_{\alpha}}{U_0 - Z_{\dot{\alpha}}}$$

$$A(1,3) = X_q - W_0 + \frac{X_{\dot{\alpha}} (U_0 + Z_{\dot{\alpha}})}{U_0 - Z_{\dot{\alpha}}}$$

$$A(1,4) = -g \cos \theta_0 + \frac{X_{\dot{\alpha}} (-g \sin \theta_0)}{U_0 - Z_{\dot{\alpha}}}$$

$$A(2,1) = \frac{Z_u^*}{U_0 - Z_{\dot{\alpha}}}$$

$$A(2,2) = \frac{Z_{\alpha}}{U_0 - Z_{\dot{\alpha}}}$$

$$A(2,3) = \frac{U_0 + Z_q}{U_0 - Z_{\dot{\alpha}}}$$

$$A(2,4) = \frac{-g \sin \theta_0}{U_0 - Z_{\dot{\alpha}}}$$

$$A(3,1) = M_u^* + \frac{M_{\dot{\alpha}} Z_u^*}{U_0 - Z_{\dot{\alpha}}}$$

$$A(3,2) = M_{\alpha} + \frac{M_{\dot{\alpha}} Z_{\alpha}}{U_0 - Z_{\dot{\alpha}}}$$

$$A(3,3) = M_q + \frac{M_{\dot{\alpha}} (U_0 + Z_q)}{U_0 - Z_{\dot{\alpha}}}$$

$$A(3,4) = \frac{-M_{\dot{\alpha}} g \sin \theta_0}{U_0 - Z_{\dot{\alpha}}}$$

$$A(4,1) = 0$$

$$A(4,2) = 0$$

$$A(4,3) = 1$$

$$A(4,4) = 0$$

The elements of the B matrix are:

$$B(1,1) = X_{\delta_s} + \frac{X_{\dot{\alpha}} Z_{\delta_s}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(2,1) = \frac{Z_{\delta_s}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(3,1) = M_{\delta_s} + \frac{M_{\dot{\alpha}} Z_{\delta_s}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(4,1) = 0$$

$$B(1,2) = X_{\delta_t} + \frac{X_{\dot{\alpha}} Z_{\delta_t}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(2,2) = \frac{Z_{\delta_t}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(3,2) = M_{\delta_t} + \frac{M_{\dot{\alpha}} Z_{\delta_t}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(4,2) = 0$$

$$B(1,3) = X_{\dot{\alpha}} + \frac{X_{\dot{\alpha}} Z_{\delta_c}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(2,3) = \frac{Z_{\delta_c}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(3,3) = M_{\dot{\alpha}} + \frac{M_{\dot{\alpha}} Z_{\delta_c}}{U_0 - Z_{\dot{\alpha}}}$$

$$B(4,3) = 0$$

Terms with subscripts of δ_s , δ_f , or δ_c are associated with the strake, flaperon, or canard control surfaces, respectively.

Lateral-Directional State Space Model

The state vector x contains angle of sideslip, roll rate, yaw rate, and bank angle. The input vector u contains aileron and rudder deflections. The elements of the A matrix are:

$$A(1,1) = \frac{Y_\beta}{V_{T_0}}$$

$$A(1,2) = \frac{Y_p + W_0}{V_{T_0}}$$

$$A(1,3) = \frac{Y_r - U_0}{V_{T_0}}$$

$$A(1,4) = \frac{g \cos \theta_0}{V_{T_0}}$$

$$A(2,1) = L'_\beta$$

$$A(2,2) = L'_p$$

$$A(2,3) = L'_r$$

$$A(2,4) = 0$$

$$A(3,1) = N'_\beta$$

$$A(3,2) = N'_p$$

$$A(3,3)=N_r'$$

$$A(3,4)=0$$

$$A(4,1)=0$$

$$A(4,2)=1$$

$$A(4,3)=\frac{\sin \theta_0}{\cos \theta_0}$$

$$A(4,4)=0$$

The elements of the B matrix are:

$$B(1,1)=\frac{Y_{\delta_a}}{V_{T_0}}$$

$$B(1,2)=\frac{Y_{\delta_r}}{V_{T_0}}$$

$$B(2,1)=L_{\delta_a}'$$

$$B(2,2)=L_{\delta_r}'$$

$$B(3,1)=N_{\delta_a}'$$

$$B(3,2)=N_{\delta_r}'$$

$$B(4,1)=0$$

$$B(4,2)=0$$

Terms with subscripts of δ_a or δ_r , are associated with the aileron or rudder control surfaces, respectively.

EXPLANATION OF COMPUTER PRINTOUTS

The computer printout is divided into six pages for each trim condition. The first page is a printout of the trim condition including the aircraft state, positions of the controls, the trim aerodynamics, and aircraft constants. The second page is a printout of all of the nondimensional aero derivatives and thrust-related derivatives. The third page is a printout of the longitudinal dimensional stability derivatives, the longitudinal state space

model, the roots of the longitudinal characteristic dynamic equation, and the period, damping ratio, damped and undamped natural frequencies for each complex pair of roots present in the characteristic equation. The fourth page is a printout of all longitudinal transfer functions for each state output to each control surface input and the transfer function for normal acceleration output at the center of gravity to each control surface input. The fifth page is a printout of the lateral-directional dimensional derivatives, the lateral-directional state space model, the roots of the lateral-directional characteristic dynamic equation, and the period, damping ratio, damped and undamped natural frequencies for each complex pair of roots present in the characteristic equation. The sixth page is a printout of all lateral-directional transfer functions for each state output to each control surface input and the transfer function for side acceleration output at the center of gravity to each control surface input.

The first page summary of the trim condition is fairly self-explanatory. All trim conditions are for straight, wings-level, 1g flight. All angular values are in degrees. The variable "VTRFPS" is the aircraft trim airspeed in feet per second. The fuselage station and waterline position of the center of gravity are given as the variables "XCG" and "ZCG", respectively, and are in inches. The flight control system MODE status logicals at the bottom of the AIRCRAFT STATE section are a carryover from the original linearization software code and have no effect on the linear model given in the printout. The model is strictly for the airframe aerodynamics and thrust variation with Mach. Based on the signs of the nondimensional and dimensional derivatives, the three longitudinal controls, canards, flaps, and strakes are positive trailing edge down. The rudder is positive trailing edge left and the ailerons are positive right wing surface trailing edge up. The thrust at trim is shown in pounds. Also, although not printed out, the thrust line is above the center of gravity by a distance of 75.204 inches minus the value of "ZCG" (negative pitching moment). The variable "% RPM" is the percent of full throttle required to set the thrust at the trim value. The nondimensional aero coefficients at trim are given in the DYNAMICS section and are positive in the positive directions of the axis system as explained earlier.

The second page of the printout is a listing of all of the nondimensional aero derivatives and thrust variation with Mach perturbation. The calculation of the nondimensional derivatives and thrust variation is consistent with Appendix A of NASA CR-2144.

The third page of the printout lists the longitudinal dimensional stability derivatives, with units shown. The thrust variation with Mach perturbation has been included in the calculation of these dimensional derivatives. The longitudinal state space model A and B matrices are then printed out. All angular states, "ALPHA", "Q", and "THETA", and the control surface inputs, "STRAKE", "FLAPRN", and "CANARD" in this model have units of radians or radians/second, as appropriate, and the speed state, "VEL", has units of feet/second. The system roots of the A matrix are then printed out in real/imaginary form. Finally, the period, damping ratio, and damped and undamped natural frequencies for any complex pair of system roots is printed out.

The fourth page of the printout lists the transfer functions in Laplace form for the

output of each state to each control surface input. The units on the transfer functions are the same as the units on the states and surface deflections in the state space model. Also, the transfer function of the acceleration at the center of gravity in the z direction to each control surface input is also listed as "AN/STRK", "AN/FLAP", AND "AN/CAN". These transfer functions are based on the states according to the following equation:

$$AN = U_0 \dot{\alpha} - U_0 q + (g \sin \theta_0) \theta$$

The units on this acceleration are feet/second² and it is positive in the positive z direction.

The fifth and sixth pages repeat the same type of information for the lateral-directional motion as the third and fourth pages did for the longitudinal motion. The lateral-directional dimensional derivatives have units as shown. The lateral-directional state space model states and surface deflections all have units of radians or radians/second, as appropriate. The transfer functions include the acceleration at the center of gravity in the y direction for aileron and rudder deflections, "AY/AIL" and "AY/RUD", respectively. The transfer functions are based on the states according to the following equation:

$$AY = U_0 \dot{\beta} - (g \cos \theta_0) \phi + U_0 r - W_0 p$$

The units on this acceleration are feet/second² and it is positive in the positive y direction.

Computer Printout Variables By Page

Page 1

The variables printed out on page 1 are as follows:

ACGW	Aircraft gross weight, pounds
AREA	Reference wing area, feet ²
AILERON	Trim aileron deflection, positive right wing surface trailing edge up, degrees
ALPHA	Trim angle of attack, positive nose up, degrees
ALT	Altitude above sea level, positive up, feet

AR MODE	Flight control system mode, not used
BETA	Trim angle of sideslip, positive nose right, degrees
CANARDS	Trim canard deflection, positive trailing edge down, degrees
CBAR	Reference chord, feet
CLMAERO	Trim nondimensional x-axis aero moment coefficient, positive right wing down
CMMAERO	Trim nondimensional y-axis aero moment coefficient, positive nose up
CNMAERO	Trim nondimensional z-axis aero moment coefficient, positive nose right
CXAERO	Trim nondimensional x-axis aero force coefficient, positive forward
CYAERO	Trim nondimensional y-axis aero force coefficient, positive out the right wing
CZAERO	Trim nondimensional z-axis aero force coefficient, positive out the bottom of the airplane
DR MODE	Flight control system mode, not used
DYN PR	Trim dynamic pressure, pounds/feet ²
FLAPS	Trim flaperon deflection, positive trailing edge down, degrees
GAMMA	Trim flight path angle, positive up, degrees
GEAR DOWN	Landing gear up if F(also), down if T(rue), always F
IXX	Aircraft x-axis moment of inertia, slug-feet ²
IXZ	Aircraft product of inertia, slug-feet ²
IYY	Aircraft y-axis moment of inertia, slug-feet ²
IZZ	Aircraft z-axis moment of inertia, slug-feet ²
MACH	Mach number, dimensionless
NORMAL MODE	Flight control system mode, not used

NX	Trim forward acceleration in g's, positive forward, dimensionless, always zero
NY	Trim side acceleration in g's, positive to the right, dimensionless, always zero
NZ	Trim normal acceleration in g's, positive out top of airplane, dimensionless
% RPM	Trim throttle setting, percent of full setting
RHO	Air density, slugs/feet ³
RUDDER	Trim rudder deflection, positive trailing edge left, degrees
SPAN	Reference wing span, feet
STRAKES	Trim strake deflection, positive trailing edge down, degrees
THETA	Trim pitch attitude, positive nose up, degrees
THRUST	Trim engine thrust, positive forward, pounds
VC KTS	Trim calibrated airspeed, knots
VTRFPS	True airspeed, positive forward, feet/second
XCG	Fuselage station position of the center of gravity, positive forward, inches
ZCG	Waterline position of the center of gravity, positive up, inches

Page 2

This page is fairly self-explanatory. All nondimensional stability derivatives are per radian for angular perturbations and per Mach number for the Mach derivatives. Thrust is separated from the aerodynamic derivatives as shown in the far right column. Thrust only varies with Mach number. Thrust variation with all other longitudinal perturbations is zero as shown. Thrust variation with Mach number has units of pounds per Mach number as shown.

Page 3

All dimensional stability derivatives have units as shown at the top of each column and at the left of each row. For example, the units for Z_α are feet/second² per radian. The "feet/second²" is shown at the top of the "Z" column just under the "Z" and the "per radian" is shown at the left next to the "ALPHA".

The state space model variables are as follows:

ALPHA	Angle of attack, positive nose up, radians
CANARD	Canard deflection, positive trailing edge down, radians
FLAPRN	Flap deflection, positive trailing edge down, radians
Q	Pitch rate, positive nose up, radians/second
STRAKE	Strake deflection, positive trailing edge down, radians
THETA	Pitch attitude, positive nose up, radians
VEL	X-axis velocity, positive forward, feet/second

The SYSTEM POLES are the roots of the characteristic equation of the A matrix in real, imaginary form.

The DYNAMICS variables for each pair of complex SYSTEM POLES are as follows:

PERIOD	Period for one cycle, seconds
WD	Damped natural frequency, radians/second
WN	Undamped natural frequency, radians/second
ZETA	Damping ratio, dimensionless

Page 4

This page lists all of the longitudinal transfer functions in polynomial form for each state output to each control surface deflection input. It also gives the transfer function for the z-axis acceleration at the center of gravity to each control surface input. The output and input variables are as follows:

ALP	Angle of attack, positive nose up, radians
AN	Z-axis acceleration at center of gravity, positive out bottom of airplane, feet/second ²
CAN	Canard deflection, positive trailing edge down, radians
FLAP	Flap deflection, positive trailing edge down, radians
Q	Pitch rate, positive nose up, radians/second

STRK	Strake deflection, positive trailing edge down, radians
THT	Pitch attitude, positive nose up, radians
U	X-axis velocity, positive forward, feet/second

Page 5

All dimensional stability derivatives have units as shown at the top of each column and at the left of each row the same as page 3.

The state space model variables are as follows:

AIL	Aileron deflection, positive right wing surface trailing edge up, radians
BETA	Angle of sideslip, positive nose right, radians
P	Roll rate, positive right wing down, radians/second
PHI	Bank angle, positive right wing down, radians
R	Yaw rate, positive nose right, radians/second
RUD	Rudder deflection, positive trailing edge left, radians

The SYSTEM POLES and DYNAMICS are listed the same as for page 3.

Page 6

This page lists all of the lateral-directional transfer functions in polynomial form for each state output to each control surface deflection input. It also gives the transfer function for the y-axis acceleration at the center of gravity to each control surface input. The variable names and units are the same as the state space model names and units on page 5. AY is the y-axis acceleration at the center of gravity. It is positive out the right side of the airplane and has units of feet/second².
